

Part F — Management Recommendations

Based on the validated analytical findings from the FinTrust dashboard, the following management recommendations are proposed:

1. Account Lifecycle and Re-Engagement

Finding: Account status is heavily concentrated among active accounts, while dormant accounts represent a smaller proportion of the customer base.

Evidence: The Customer Distribution by Account Status chart on Page 2 shows a clear difference between active and dormant accounts.

Business Implication: The dormant customer segment represents an opportunity to increase customer engagement and recover potentially inactive accounts.

Recommended Action: Develop targeted re-engagement campaigns through in-app notifications and email, using personalized messages and appropriate incentives to encourage dormant customers to resume activity.

2. Mobile Infrastructure and User Experience Optimization

Finding: The mobile app is the dominant payment channel, recording substantially higher usage than USSD and other channels.

Evidence: The Transaction by Payment Method chart on Page 1 shows mobile app transactions leading the other payment channels.

Business Implication: Because the mobile app handles a significant share of customer transactions, disruptions or poor user experience could affect a substantial portion of transaction activity.

Recommended Action: Prioritize continuous monitoring of mobile app performance, user experience improvements, and infrastructure scalability to support reliable transaction processing.

3. Regional Targeted Marketing and Expansion

Finding: Customer distribution varies considerably across locations, with some urban centers accounting for higher customer volumes than others.

Evidence: The Customer Distribution by Location chart on Page 2 shows varying customer concentrations across locations including Abuja, Benin City, Enugu, Ibadan, and Kaduna.

Business Implication: Differences in geographic customer concentration provide an opportunity to develop more targeted regional engagement and expansion strategies.

Recommended Action: Use location-level customer data to tailor marketing campaigns and partnerships to high-density areas while conducting further market analysis before expanding into lower-density regions.

4. Transaction Value Protection and Customer Retention

Finding: FinTrust processes a substantial transaction value, with an average transaction value of approximately ₦45.60K.

Evidence: The FinTrust Transaction Overview KPI section shows approximately ₦68.36M in total transaction value across 1,499 transactions.

Business Implication: The presence of relatively high-value transactions makes effective customer retention, transaction reliability, and value protection important to overall transaction performance.

Recommended Action: Identify customers and transaction segments associated with higher transaction values and develop appropriate retention and customer-engagement strategies based on their transaction behavior.

5. Risk Assessment and Fraud Mitigation Refinement

Finding: A measurable proportion of transactions is flagged for risk review, while the majority proceeds through the standard transaction process.

Evidence: The Transaction by Risk Status donut chart on Page 1 shows the proportion of transactions requiring risk review.

Business Implication: The risk-review pattern highlights the need to balance effective fraud detection with a smooth experience for legitimate customers.

Recommended Action: Analyze historical risk-review patterns to identify recurring risk indicators and refine fraud-monitoring rules, while regularly evaluating false positives and legitimate transaction interruptions.
