

Part E – Validated Business Findings

1 Account Status and Volume Distribution

Finding: Account status is heavily concentrated among active accounts, while dormant accounts represent a much smaller proportion of the customer base.

Evidence: The Customer Distribution by Account Status chart on Page 2 shows a substantially larger bar for active accounts compared with dormant accounts.

Validation: The Total Customers KPI on Page 1 shows approximately 1.499K customers, confirming the size of the customer base.

Business Meaning: The high proportion of active accounts indicates strong current customer engagement, while the smaller dormant segment presents an opportunity for targeted re-engagement strategies.

2. Payment Channel Utilization

Finding: The mobile app is the dominant payment channel, recording substantially higher usage than USSD and other channels.

Evidence: The Transaction by Payment Method chart on Page 1 shows mobile app transactions leading other payment methods.

Validation: The Customer Distribution by Payment Channel visual on Page 2 also shows the mobile app as the leading channel, supporting the consistency of this preference across the dashboard.

Business Meaning: The strong reliance on the mobile app highlights the importance of maintaining a reliable and user-friendly mobile transaction experience.

3. Geographic Concentration and Location Density

Finding: Customer distribution varies considerably across locations, with some urban centers accounting for a larger share of the customer base.

Evidence: The Customer Distribution by Location horizontal bar chart on Page 2 shows different customer volumes across locations including Abuja, Benin City, Enugu, Ibadan, and Kaduna.

Validation: The location slicer allows these regional segments to be examined individually, confirming that customer distribution is not uniform across locations.

Business Meaning: Understanding geographic concentration can help FinTrust tailor marketing, customer engagement, and expansion strategies to areas with higher customer density.

4. Transaction Value and Volume Scale

Finding: FinTrust processes a substantial transaction value across its transaction base, with an average transaction value of approximately ₦45.60K.

Evidence: The FinTrust Transaction Overview KPI section shows approximately ₦68.36M in total transaction value and 1,499 transactions.

Validation: Dividing the total transaction value by the total number of transactions gives an average transaction value of approximately ₦45.60K.

Business Meaning: The relatively high average transaction value highlights the importance of effective transaction monitoring, risk management, and customer-value protection.

5. Risk Review and Flagging Patterns

Finding: A measurable proportion of transactions is flagged for risk review, while the majority proceeds through the standard transaction process.

Evidence: The Transaction by Risk Status donut chart on Page 1 shows the proportion of transactions requiring risk review compared with those not flagged.

Validation: The Transaction by Status visual provides an additional view of successful and unsuccessful/flagged transactions, supporting the presence of identifiable transaction exceptions.

Business Meaning: Understanding the drivers of risk-reviewed transactions can help FinTrust improve fraud detection while minimizing unnecessary transaction friction for legitimate customers.
